

Why am I at risk? After surgery, patients can be at risk for Deep Vein Thrombosis (DVT) because they are typically less ambulatory and their blood can be more susceptible to clotting. DVT is a blood clot that forms in a vein deep in the body, most often in the calf or thigh. If a clot breaks loose and travels to the lungs, it can be life threatening.*

What is VenaPro?

VenaPro is a compression device that helps keep blood moving through your veins, similar to the way walking stimulates blood flow. This increased blood circulation works to help prevent DVT.

VenaPro assists with post-operative recovery by:

- Aiding in the prevention of deep vein thrombosis
- Increasing blood circulation
- Reducing pain and edema

Product Details

- One pair of devices and battery charger included
- Easy one-button operation
- Squeezes once per minute, applying 50mmHg of compression
- 20-hour battery life
- LED light indicators
- Soft, comfortable sleeve material

Part number

Description	Part #
VenaPro System (pair)	08-0035
